## General Description

The A2V64S40CTP is 67,108,864 bits synchronous high data rate Dynamic RAM organized as 4 x 1,048,576 words by 16 bits. Synchronous design allows precise cycle controls with the use of system clock I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable burst length and programmable latencies allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

## Features

- 3.3V power supply
- LVTTTL compatible with multiplexed address
- Four banks operation
- MRS cycle with address key programs
  - CAS latency (2 & 3)
  - Burst length (1, 2, 4, 8 & Full page)
  - Burst type (Sequential & Interleave)
- All inputs are sampled at the positive going edge of the system clock
- Auto & self refresh
- 64ms refresh period (4K cycle)
- Burst read single write operation
- LDQM & UDQM for masking

## Pin Descriptions

SYMBOL	TYPE	DESCRIPTION
CLK	Input	Clock: CLK is driven by the system clock. All SDRAM input signals are sampled on the positive edge of CLK. CLK also increments the internal burst counter and controls the output registers.
CKE	Input	Clock Enable: CKE activates (HIGH) and deactivates (LOW) the CLK signal. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), ACTIVE POWER-DOWN (row active in any bank), DEEP POWER DOWN (all banks idle), or CLOCK SUSPEND operation (burst/access in progress). CKE is synchronous except after the device enters power-down and self refresh modes, where CKE becomes asynchronous until after exiting the same mode. The input buffers, including CLK, are disabled during power-down and self refresh modes, providing low standby power. CKE may be tied HIGH.
/CS	Input	Chip Select: /CS enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when /CS is registered HIGH. /CS provides for external bank selection on systems with multiple banks. /CS is considered part of the command code.
/CAS, /RAS, /WE	Input	Command Inputs: /CAS, /RAS, and /WE (along with /CS) define the command being entered.
LDQM, UDQM,	Input	Input/Output Mask: DQM is sampled HIGH and is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked during a WRITE cycle. The output buffers are placed in a High-Z state (two-clock latency) when during a READ cycle. LDQM corresponds to DQ0–DQ7, UDQM corresponds to DQ8–DQ15. LDQM and UDQM are considered same state when referenced as DQM.
BA0, BA1	Input	Bank Address Input(s): BA0 and BA1 define to which bank the ACTIVE, READ, WRITE or PRECHARGE command is being applied. These pins also select between the mode register and the extended mode register.
A0–A11	Input	Address Inputs: A0–A11 are sampled during the ACTIVE command (row address A0–A11) and READ/WRITE command (column-address A0–A7; with A10 defining auto precharge) to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine if all banks are to be precharged (A10 HIGH) or bank selected by BA0, BA1 (LOW). The address inputs also provide the op-code during a LOAD MODE REGISTER command.
DQ0–DQ15	I/O	Data Input/Output: Data bus.
NC	–	Internally Not Connected: These could be left unconnected, but it is recommended they be connected or Vss.
VDDQ	Supply	DQ Power: Provide isolated power to DQs for improved noise immunity.
VssQ	Supply	DQ Ground: Provide isolated ground to DQs for improved noise immunity.
VDD	Supply	Core Power Supply.
Vss	Supply	Ground.

### ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V <sub>ss</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-1.0 ~ 4.6	V
Voltage on V <sub>DD</sub> supply relative to V <sub>ss</sub>	V <sub>DD</sub> , V <sub>DDQ</sub>	-1.0 ~ 4.6	V
Storage temperature	T <sub>STG</sub>	-55 ~ +150	° C
Power dissipation	P <sub>D</sub>	1.0	W
Short circuit current	I <sub>OS</sub>	50	mA

**NOTES:**

Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.  
Functional operation should be restricted to recommended operating condition.  
Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

### DC OPERATING CONDITIONS

Recommended operating conditions (Voltage referenced to V<sub>ss</sub> = 0V, T<sub>A</sub> = -25 to 85° C for Extended, 0 to 70° C for Commercial)

Parameter	Symbol	Min	Typ	Max	Unit	Note
Supply voltage	V <sub>DD</sub>	3.0	3.3	3.6	V	
	V <sub>DDQ</sub>	3.0	3.3	3.6	V	
Input logic high voltage	V <sub>IH</sub>	2.0		V <sub>DDQ</sub> + 0.3	V	1
Input logic low voltage	V <sub>IL</sub>	-0.3	0	0.8	V	2
Output logic high voltage	V <sub>OH</sub>	2.4	-	-	V	I <sub>OH</sub> = -0.1mA
Output logic low voltage	V <sub>OL</sub>	-	-	0.4	V	I <sub>OL</sub> = 0.1mA
Input leakage current	I <sub>LI</sub>	-5	-	5	uA	3
Output leakage current	I <sub>OL</sub>	-5	-	5	uA	3

**Note:**

- V<sub>IH</sub>(max) = 4.6V AC for pulse width ≤ 10ns acceptable.
- V<sub>IL</sub>(min) = -1.5V AC for pulse width ≤ 10ns acceptable.
- Any input 0V ≤ V<sub>IN</sub> ≤ V<sub>DD</sub> + 0.3V, all other pins are not under test = 0V.
- Dout is disabled, 0V ≤ V<sub>OUT</sub> ≤ V<sub>DD</sub>.

### CAPACITANCE (V<sub>dd</sub> = 3.3V, T<sub>A</sub> = 23°C, f = 1MHz, V<sub>ref</sub> = 0.9V ± 50mV)

### OPERATING AC PARAMETER

(AC operating conditions unless otherwise noted)

Parameter	Symbol	Version				Unit	Note
		-5	-6	-7	-75		
Row active to row active delay	tRRD(min)	10	12	14	15	ns	1
RAS to CAS delay	tRCD(min)	15	18	21	21	ns	1
Row precharge time	tRP(min)	15	18	21	21	ns	1
Row active time	tRAS(min)		40	42	45	ns	1
	tRAS(max)	100	100	100	100	us	
Row cycle time	tRC(min)		58	63	67.5	ns	1
Last data in to row precharge	tRDL(min)	2	2	2	2	CLK	2
Last data in to Active delay	tDAL(min)					-	
Last data in to new col. address delay	tCDL(min)	1	1	1	1	CLK	2
Last data in to burst stop	tBDL(min)	1	1	1	1	CLK	2
Auto refresh cycle time	tARFC(min)		60	70	75	ns	

**NOTES:**

1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
2. Minimum delay is required to complete write.

	CAS latency=2				6		6		6			

**NOTES :**

- Parameters depend on programmed CAS latency.
- If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
- Assumed input rise and fall time (tr & tf) = 1ns.  
If tr & tf is longer than 1ns, transient time compensation should be considered, i.e., [(tr + tf)/2-1]ns should be added to the parameter.

## B. POWER UP SEQUENCE

- Apply power and attempt to maintain CKE at a high state and all other inputs may be undefined.  
- Apply VDD before or at the same time as VDDQ.
- Maintain stable power, stable clock and NOP input condition for a minimum of 200us.
- Issue precharge commands for all banks of the devices.
- Issue 2 or more auto-refresh commands.
- Issue a mode register set command to initialize the mode register.

- Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.

7. For a burst length of one, A0–A8 select the unique column to be accessed, and mode register bit M3 is ignored.

## Power-up sequence

### Power-up sequence

The SDRAM should be goes on the following sequence with power up.

The CLK, CKE, /CS, DQM and DQ pins keep low till power stabilizes.

The CLK pin is stabilized within 100  $\mu$ s after power stabilizes before the following initialization sequence.

The CKE and DQM is driven to high between power stabilizes and the initialization sequence.

This SDRAM has VDD clamp diodes for CLK, CKE, address, /RAS, /CAS, /WE, /CS, DQM and DQ pins. If the sepins go high before power up, the large current flows from these pins to VDD through the diodes.

### Initialization sequence

When 200  $\mu$ s or more has past after the above power-up sequence, all banks must be precharged using the precharge command (PALL). After tRP delay, set 8 or more auto refresh commands (REF). Set the mode register set command (MRS) to initialize the mode register. We recommend that by keeping DQM and CKE to High, the output buffer becomes High-Z during Initialization sequence, to avoid DQ bus contention on memory system formed with a number of device.

## Operation of the SDRAM

### Read/Write Operations

#### Bank active

Before executing a read or write operation, the corresponding bank and the row address must be activated by the bank active (ACT) command. An interval of  $t_{RCD}$  is required between the bank active command input and the following read/write command input.

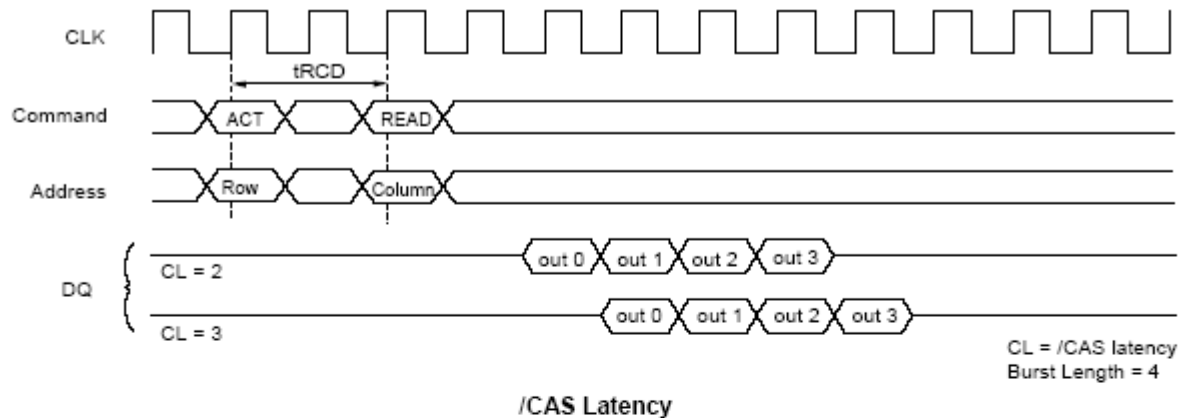

#### Read operation

A read operation starts when a read command is input. Output buffer becomes Low-Z in the  $(/CAS\ Latency - 1)$  cycle after read command set. The SDRAM can perform a burst read operation.

The burst length can be set to 1, 2, 4 and 8. The start address for a burst read is specified by the column address and the bank select address at the read command set cycle. In a read operation, data output starts after the number of clocks specified by the  $/CAS\ Latency$ . The  $/CAS\ Latency$  can be set to 2 or 3.

When the burst length is 1, 2, 4 and 8 the DOUT buffer automatically becomes High-Z at the next clock after the successive burst-length data has been output.

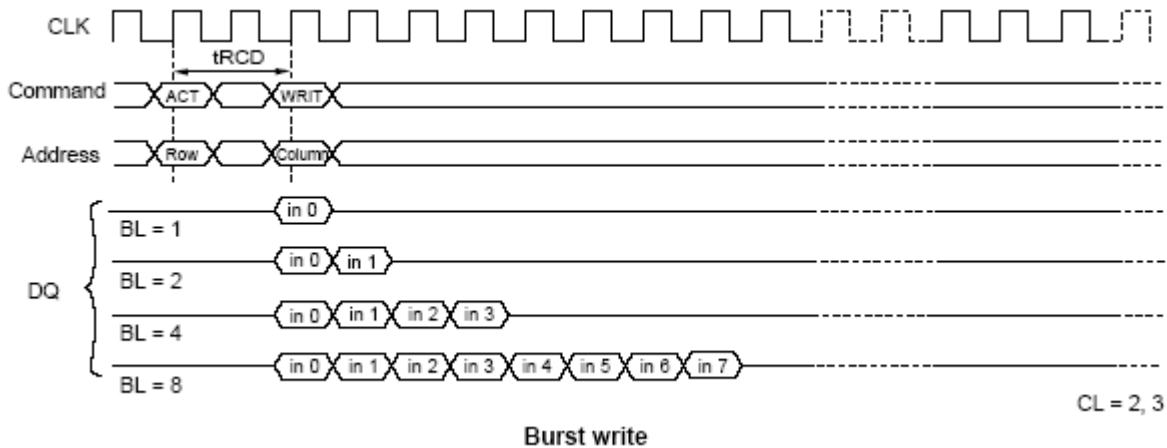

The  $/CAS\ latency$  and burst length must be specified at the mode register.

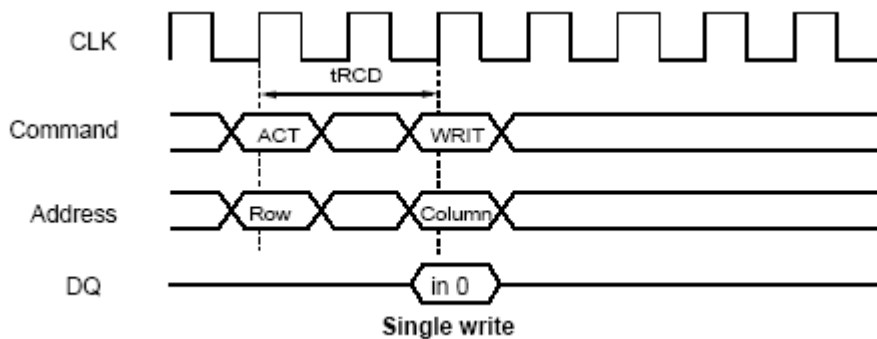

### Write operation

Burst write or single write mode is selected

1. Burst write: A burst write operation is enabled by setting OPCODE (A9, A8) to (0, 0). A burst write starts in the same clock as a write command set. (The latency of data input is 0 clock.) The burst length can be set to 1, 2, 4 and 8, like burst read operations. The write start address is specified by the column address and the bank select address at the write command set cycle.

2. Single write: A single write operation is enabled by setting OPCODE (A9, A8) to (1, 0). In a single write operation, data is only written to the column address and the bank select address specified by the write command set cycle without regard to the burst length setting. (The latency of data input is 0 clock).

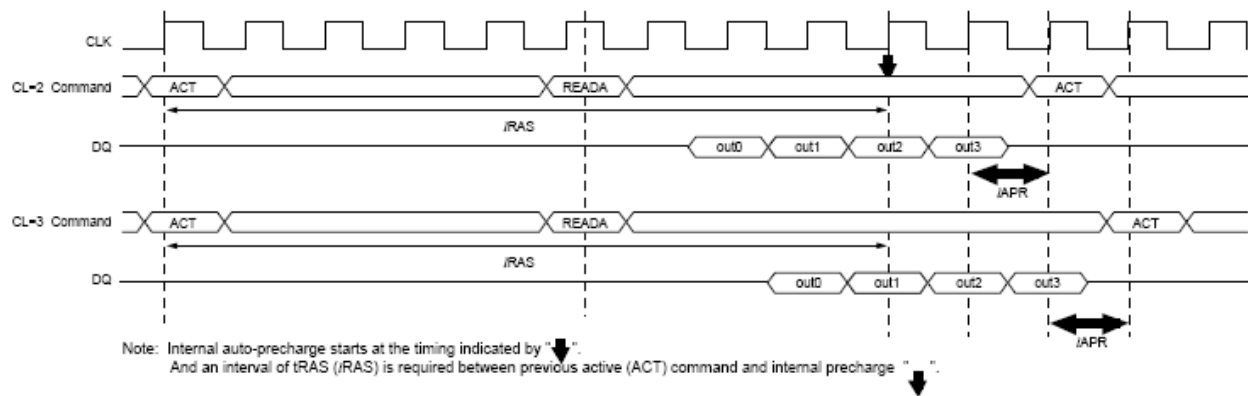

### Auto Precharge

#### Read with auto-precharge

In this operation, since precharge is automatically performed after completing a read operation, a precharge command need not be executed after each read operation. The command executed for the same bank after the execution of this command must be the bank active (ACT) command. In addition, an interval defined by *IAPR* is required before execution of the next command.

#### [Clock cycle time]

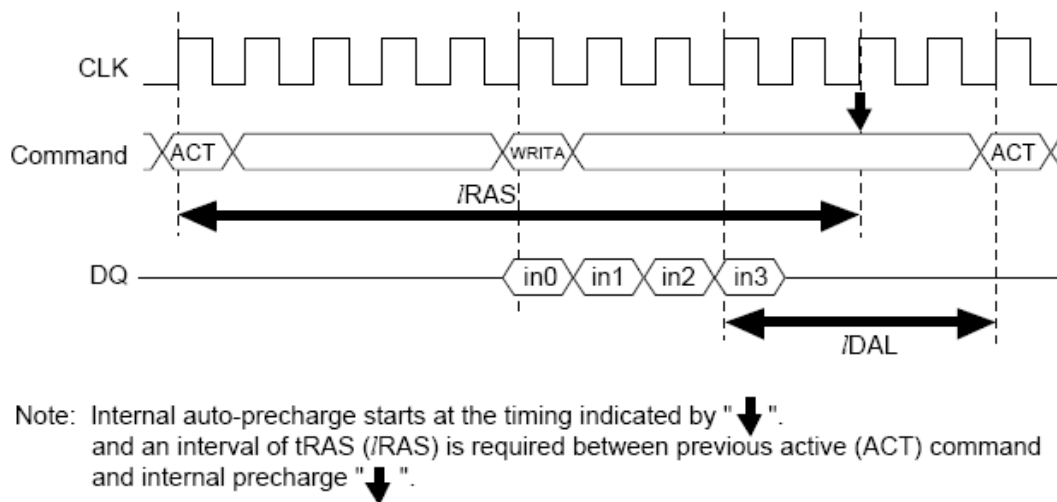

<i>t</i> /CAS latency	Precharge start cycle
3	2 cycle before the final data is output
2	1 cycle before the final data is output

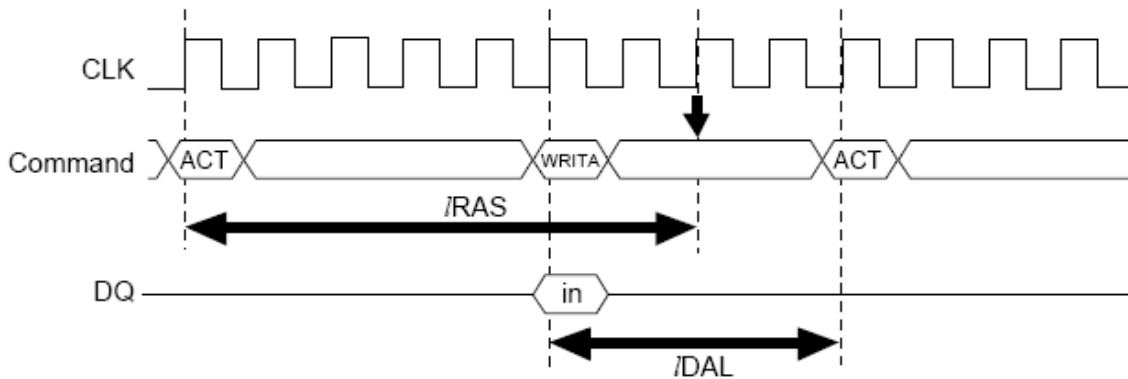

#### Burst Read (BL = 4)

#### Write with auto-precharge

In this operation, since precharge is automatically performed after completing a burst write or single write operation, a precharge command need not be executed after each write operation. The command executed for the same bank after the execution of this command must be the bank active (ACT) command. In addition, an interval of *IDAL* is required between the final valid data input and input of next command.

#### Burst Write (BL = 4)

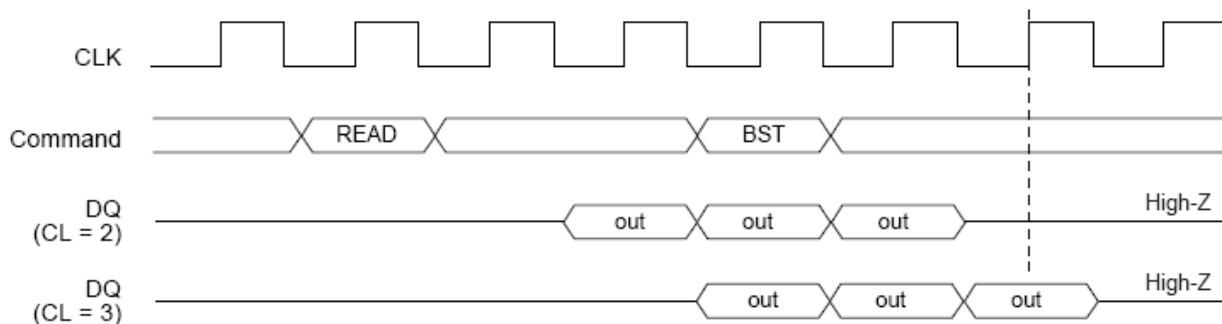

Note: Internal auto-precharge starts at the timing indicated by "↓", and an interval of  $t_{RAS}$  ( $/RAS$ ) is required between previous active (ACT) command and internal precharge "↓".

### Single Write

### Burst Stop Command

During a read cycle, when the burst stop command is issued, the burst read data are terminated and the data bus goes to High-Z after the  $/CAS$  latency from the burst stop command.

### Burst Stop at Read

During a write cycle, when the burst stop command is issued, the burst write data are terminated and data bus goes to High-Z at the same clock with the burst stop command.

### Burst Stop at Write

## Command Intervals

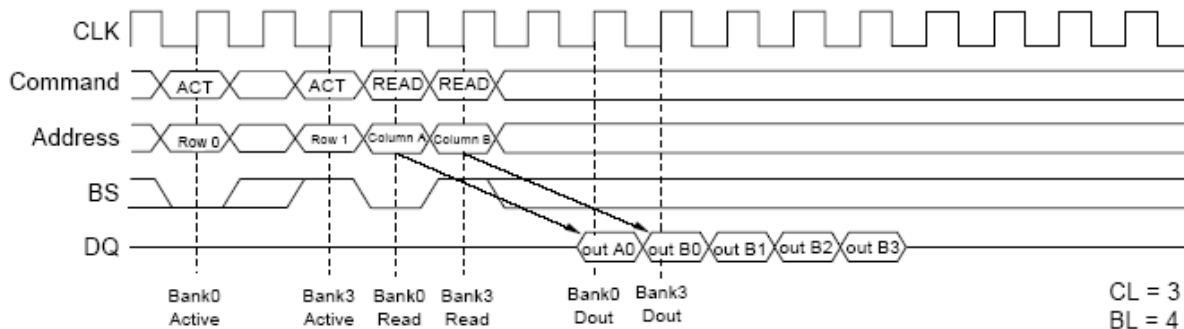

### Read command to Read command interval

1. Same bank, same ROW address: When another read command is executed at the same ROW address of the same bank as the preceding read command execution, the second read can be performed after an interval of no less than 1 clock. Even when the first command is a burst read that is not yet finished, the data read by the second command will be valid.

**READ to READ Command Interval (same ROW address in same bank)**

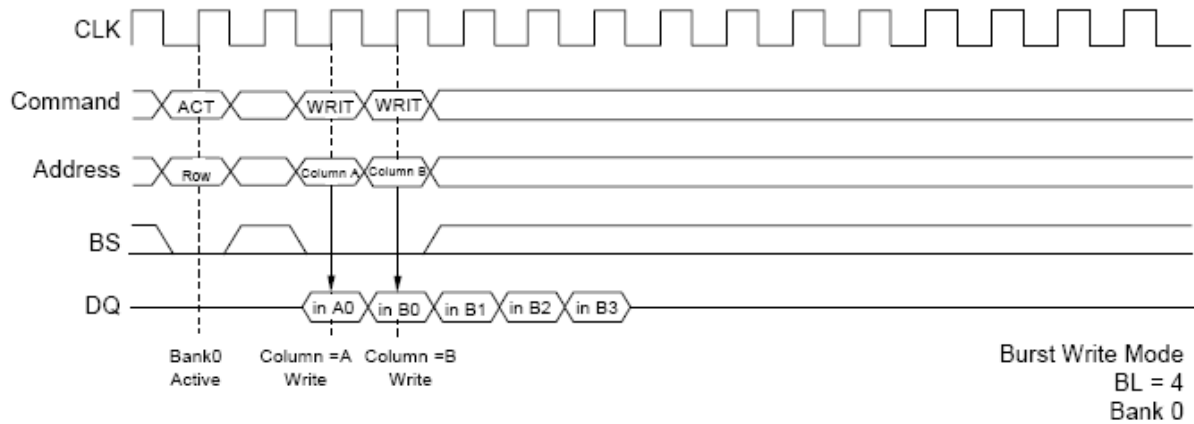

2. Same bank, different ROW address: When the ROW address changes on same bank, consecutive read commands cannot be executed; it is necessary to separate the two read commands with a precharge command and a bank active command.
3. Different bank: When the bank changes, the second read can be performed after an interval of no less than 1 clock, provided that the other bank is in the bank active state. Even when the first command is a burst read that is not yet finished, the data read by the second command will be valid.

**READ to READ Command Interval (different bank)**

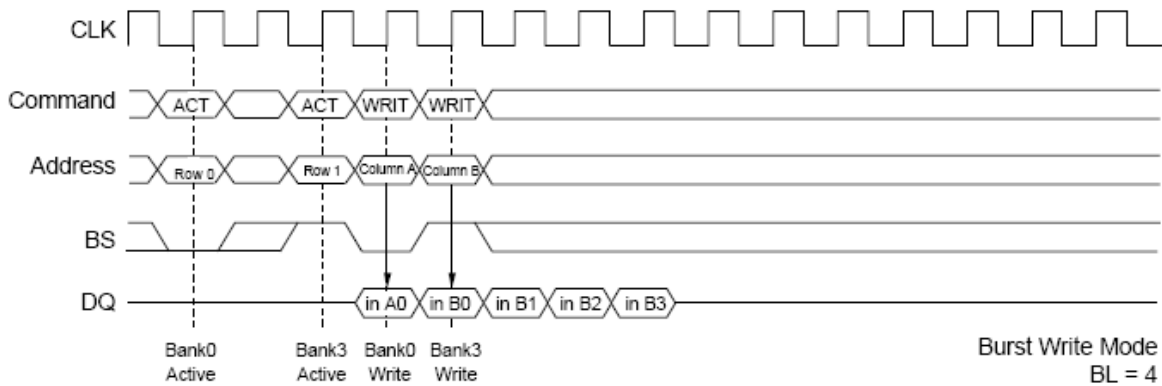

**Write command to Write command interval**

1. Same bank, same ROW address: When another write command is executed at the same ROW address of the same bank as the preceding write command, the second write can be performed after an interval of no less than 1 clock. In the case of burst writes, the second write command has priority.

**WRITE to WRITE Command Interval (same ROW address in same bank)**

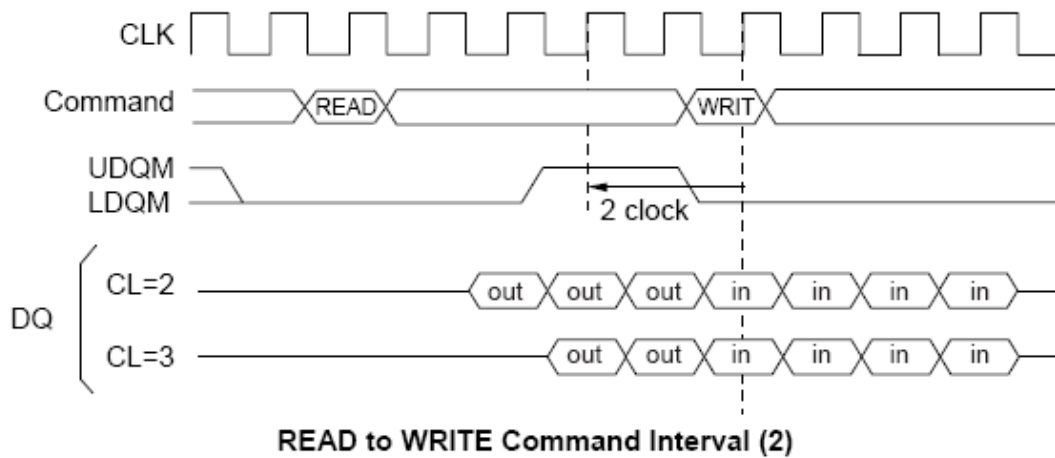

2. Same bank, different ROW address: When the ROW address changes, consecutive write commands cannot be executed; it is necessary to separate the two write commands with a precharge command and a bank active command.
3. Different bank: When the bank changes, the second write can be performed after an interval of no less than 1 clock, provided that the other bank is in the bank active state. In the case of burst write, the second write command has priority.

**WRITE to WRITE Command Interval (different bank)**

**Read command to Write command interval**

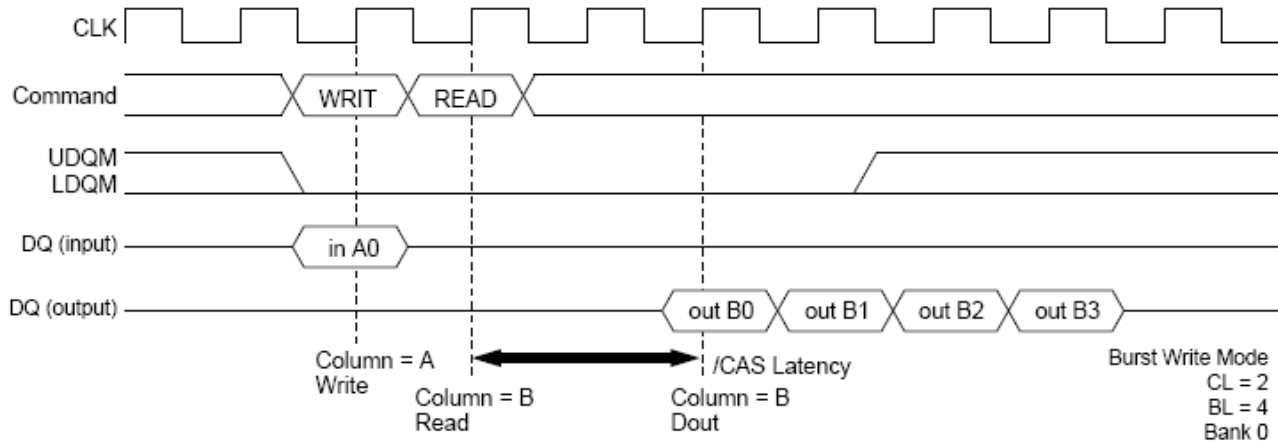

1. Same bank, same ROW address: When the write command is executed at the same ROW address of the same bank as the preceding read command, the write command can be performed after an interval of no less than 1 clock. However, UDQM and LDQM must be set High so that the output buffer becomes High-Z before data input.

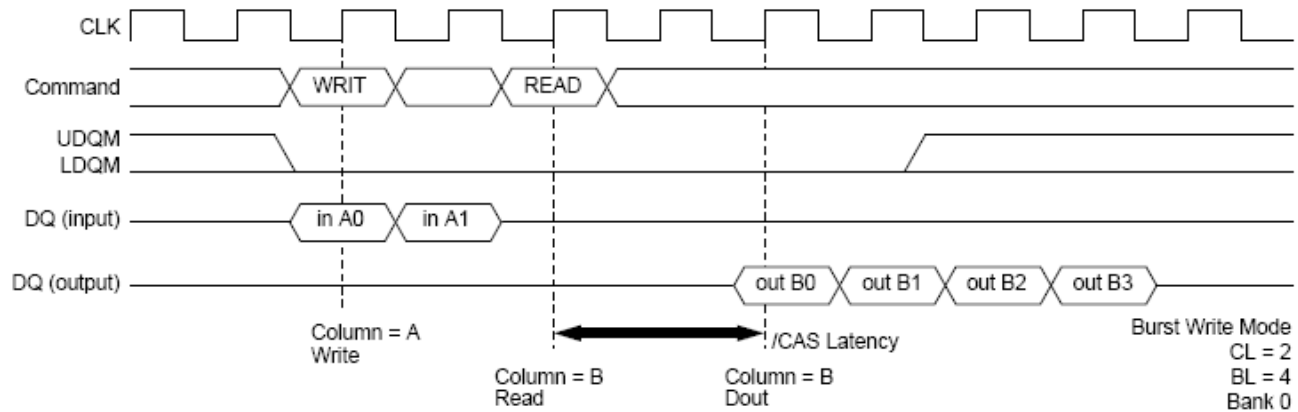

2. Same bank, different ROW address: When the ROW address changes, consecutive write commands cannot be executed; it is necessary to separate the two commands with a precharge command and a bank active command.
3. Different bank: When the bank changes, the write command can be performed after an interval of no less than 1 cycle, provided that the other bank is in the bank active state. However, UDQM and LDQM must be set High so that the output buffer becomes High-Z before data input.

**Write command to Read command interval:**

1. Same bank, same ROW address: When the read command is executed at the same ROW address of the same bank as the preceding write command, the read command can be performed after an interval of no less than 1 clock. However, in the case of a burst write, data will continue to be written until one clock before the read command is executed.

**WRITE to READ Command Interval (1)**

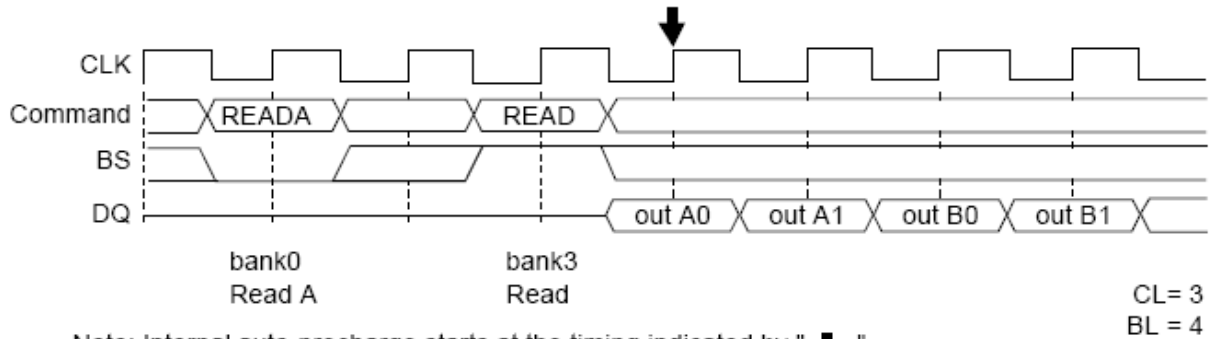

**WRITE to READ Command Interval (2)**

2. Same bank, different ROW address: When the ROW address changes, consecutive read commands cannot be executed; it is necessary to separate the two commands with a precharge command and a bank active command.
3. Different bank: When the bank changes, the read command can be performed after an interval of no less than 1 clock, provided that the other bank is in the bank active state. However, in the case of a burst write, data will continue to be written until one clock before the read command is executed (as in the case of the same bank and the same address).

**Read with auto precharge to Read command interval**

1. Different bank: When some banks are in the active state, the second read command (another bank) is executed. Even when the first read with auto-precharge is a burst read that is not yet finished, the data read by the second command is valid. The internal auto-precharge of one bank starts at the next clock of the second command.

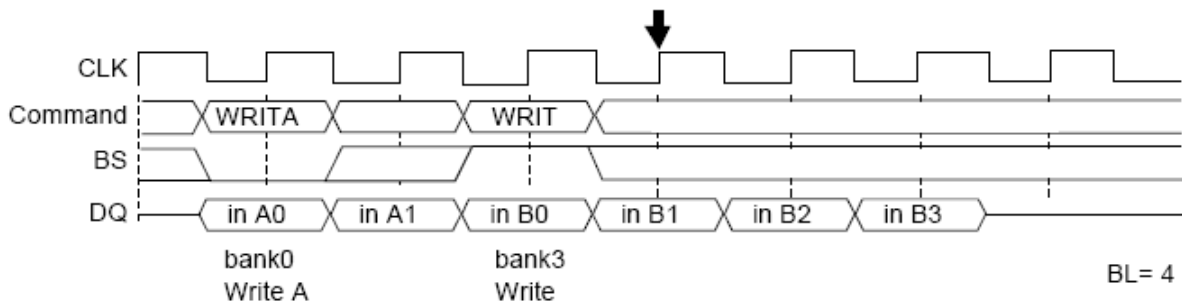

Note: Internal auto-precharge starts at the timing indicated by "↓".

**Read with Auto Precharge to Read Command Interval (Different bank)**

2. Same bank: The consecutive read command (the same bank) is illegal.

**Write with auto precharge to Write command interval**

1. Different bank: When some banks are in the active state, the second write command (another bank) is executed. In the case of burst writes, the second write command has priority. The internal auto-precharge of one bank starts 2 clocks later from the second command.

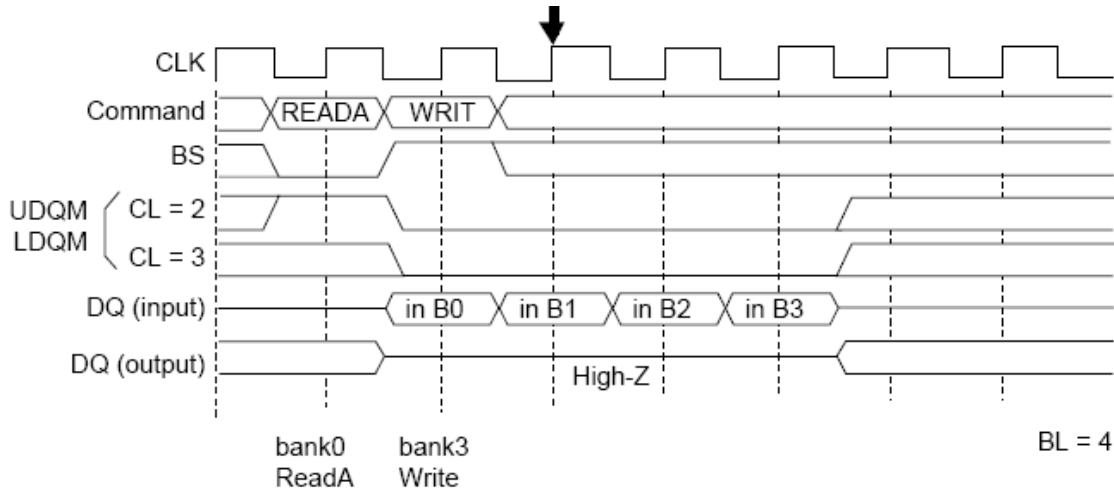

Note: Internal auto-precharge starts at the timing indicated by "↓".

**Write with Auto Precharge to Write Command Interval (Different bank)**

2. Same bank: The consecutive write command (the same bank) is illegal.

**Read with auto precharge to Write command interval**

1. Different bank: When some banks are in the active state, the second write command (another bank) is executed. However, UDQM and LDQM must be set High so that the output buffer becomes High-Z before data input. The internal auto-precharge of one bank starts at the next clock of the second command.

Note: Internal auto-precharge starts at the timing indicated by "↓".

**Read with Auto Precharge to Write Command Interval (Different bank)**

2. Same bank: The consecutive write command from read with auto precharge (the same bank) is illegal. It is necessary to separate the two commands with a bank active command.

**Write with auto precharge to Read command interval**

1. Different bank: When some banks are in the active state, the second read command (another bank) is executed. However, in case of a burst write, data will continue to be written until one clock before the read command is executed. The internal auto-precharge of one bank starts at 2 clocks later from the second command.

Note: Internal auto-precharge starts at the timing indicated by "↓".

**Write with Auto Precharge to Read Command Interval (Different bank)**

2. Same bank: The consecutive read command from write with auto precharge (the same bank) is illegal. It is necessary to separate the two commands with a bank active command.

**Read command to Precharge command interval (same bank)**

When the precharge command is executed for the same bank as the read command that preceded it, the minimum interval between the two commands is one clock. However, since the output buffer then becomes High-Z after the clocks defined by /HZP, there is a case of interruption to burst read data output will be interrupted, if the precharge command is input during burst read. To read all data by burst read, the clocks defined by /EP must be assured as an interval from the final data output to precharge command execution.

**READ to PRECHARGE Command Interval (same bank): To output all data (CL = 2, BL = 4)**

**READ to PRECHARGE Command Interval (same bank): To output all data (CL = 3, BL = 4)**

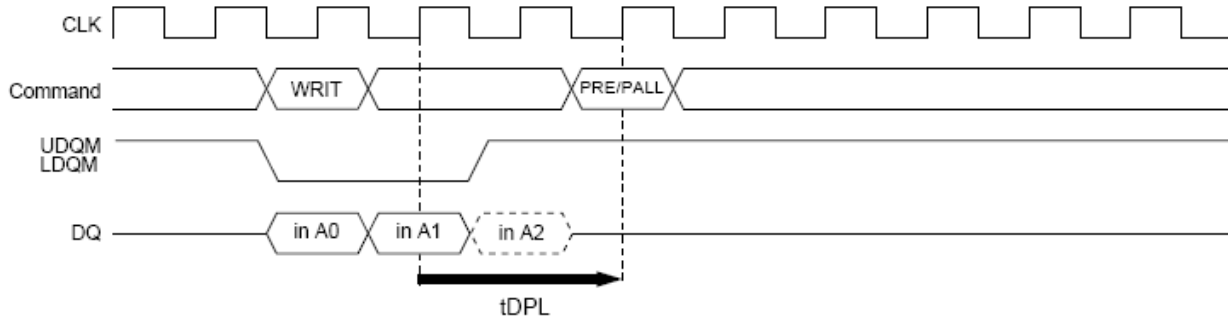

**READ to PRECHARGE Command Interval (same bank): To stop output data (CL = 2, BL = 1, 2, 4, 8)**

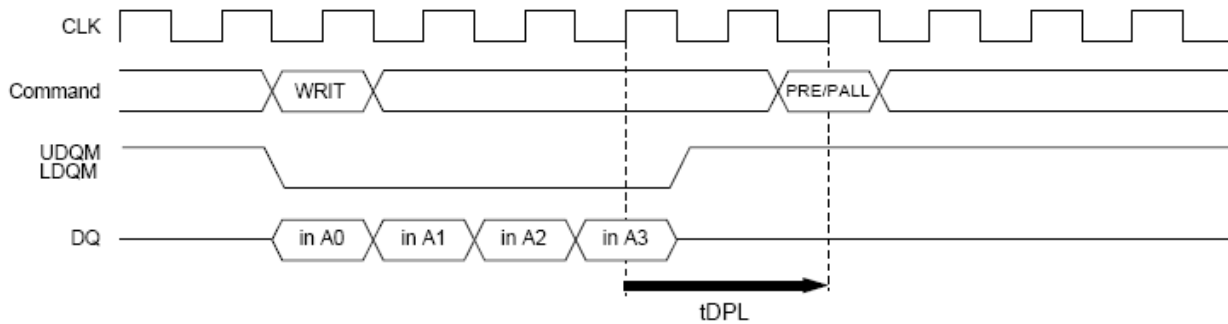

**READ to PRECHARGE Command Interval (same bank): To stop output data (CL = 3, BL = 1, 2, 4, 8)**

**Write command to Precharge command interval (same bank)**

When the precharge command is executed for the same bank as the write command that preceded it, the minimum interval between the two commands is 1 clock. However, if the burst write operation is unfinished, the input data must be masked by means of UDQM and LDQM for assurance of the clock defined by tDPL.

**WRITE to PRECHARGE Command Interval (same bank) (BL = 4 (To stop write operation))**

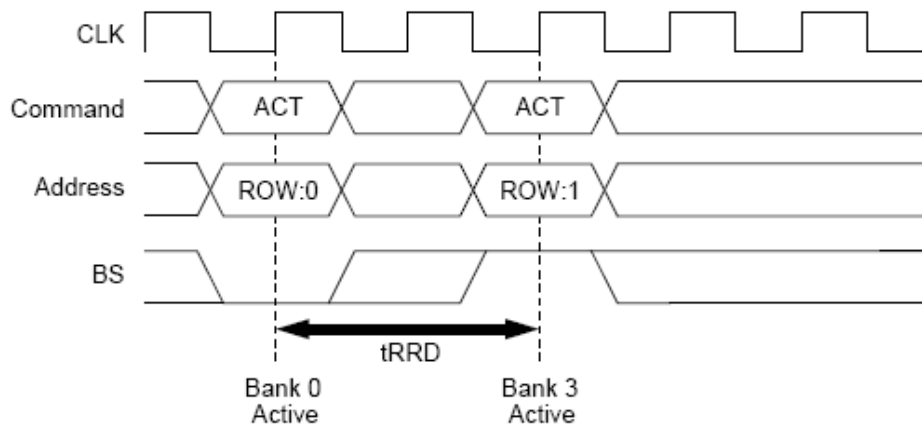

**WRITE to PRECHARGE Command Interval (same bank) (BL = 4 (To write all data))**

**Bank active command interval**

1. Same bank: The interval between the two bank active commands must be no less than  $t_{RC}$ .
2. In the case of different bank active commands: The interval between the two bank active commands must be no less than  $t_{RRD}$ .

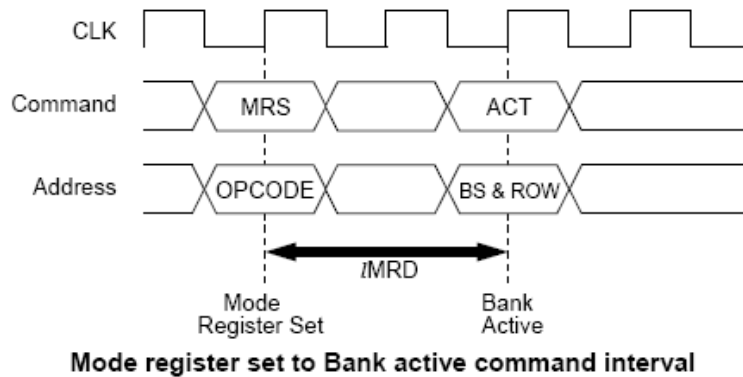

**Bank Active to Bank Active for Same Bank**

**Bank Active to Bank Active for Different Bank**

**Mode register set to Bank active command interval**

The interval between setting the mode register and executing a bank active command must be no less than  $t_{MRD}$ .

#### DQM Control

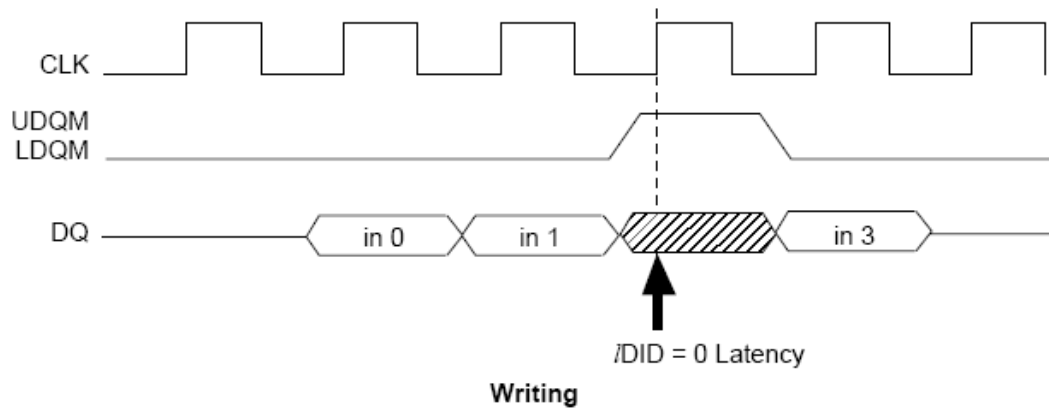

The UDQM and LDQM mask the upper and lower bytes of the DQ data, respectively. The timing of UDQM and LDQM is different during reading and writing.

#### Reading

When data is read, the output buffer can be controlled by UDQM and LDQM. By setting UDQM and LDQM to Low, the output buffer becomes Low-Z, enabling data output. By setting UDQM and LDQM to High, the output buffer becomes High-Z, and the corresponding data is not output. However, internal reading operations continue. The latency of UDQM and LDQM during reading is 2 clocks.

#### Writing

Input data can be masked by UDQM and LDQM. By setting DQM to Low, data can be written. In addition, when UDQM and LDQM are set to High, the corresponding data is not written, and the previous data is held. The latency of UDQM and LDQM during writing is 0 clock.

## Refresh

### Auto-refresh

All the banks must be precharged before executing an auto-refresh command. Since the auto-refresh command updates the internal counter every time it is executed and determines the banks and the ROW addresses to be refreshed, external address specification is not required. The refresh cycles are required to refresh all the ROW addresses within tREF (max.). The output buffer becomes High-Z after auto-refresh start. In addition, since a precharge has been completed by an internal operation after the auto-refresh, an additional precharge operation by the precharge command is not required.

### Self-refresh

After executing a self-refresh command, the self-refresh operation continues while CKE is held Low. During selfrefresh operation, all ROW addresses are refreshed by the internal refresh timer. A self-refresh is terminated by a self-refresh exit command. Before and after self-refresh mode, execute auto-refresh to all refresh addresses in or within tREF (max.) period on the condition 1 and 2 below.

1. Enter self-refresh mode within time as below\* after either burst refresh or distributed refresh at equal interval to all refresh addresses are completed.
2. Start burst refresh or distributed refresh at equal interval to all refresh addresses within time as below\*after exiting from self-refresh mode.

Note: tREF (max.) / refresh cycles.

## Others

### Power-down mode

The SDRAM enters power-down mode when CKE goes Low in the IDLE state. In power down mode, power consumption is suppressed by deactivating the input initial circuit. Power down mode continues while CKE is held Low. In addition, by setting CKE to High, the SDRAM exits from the power down mode, and command input is enabled from the next clock. In this mode, internal refresh is not performed.

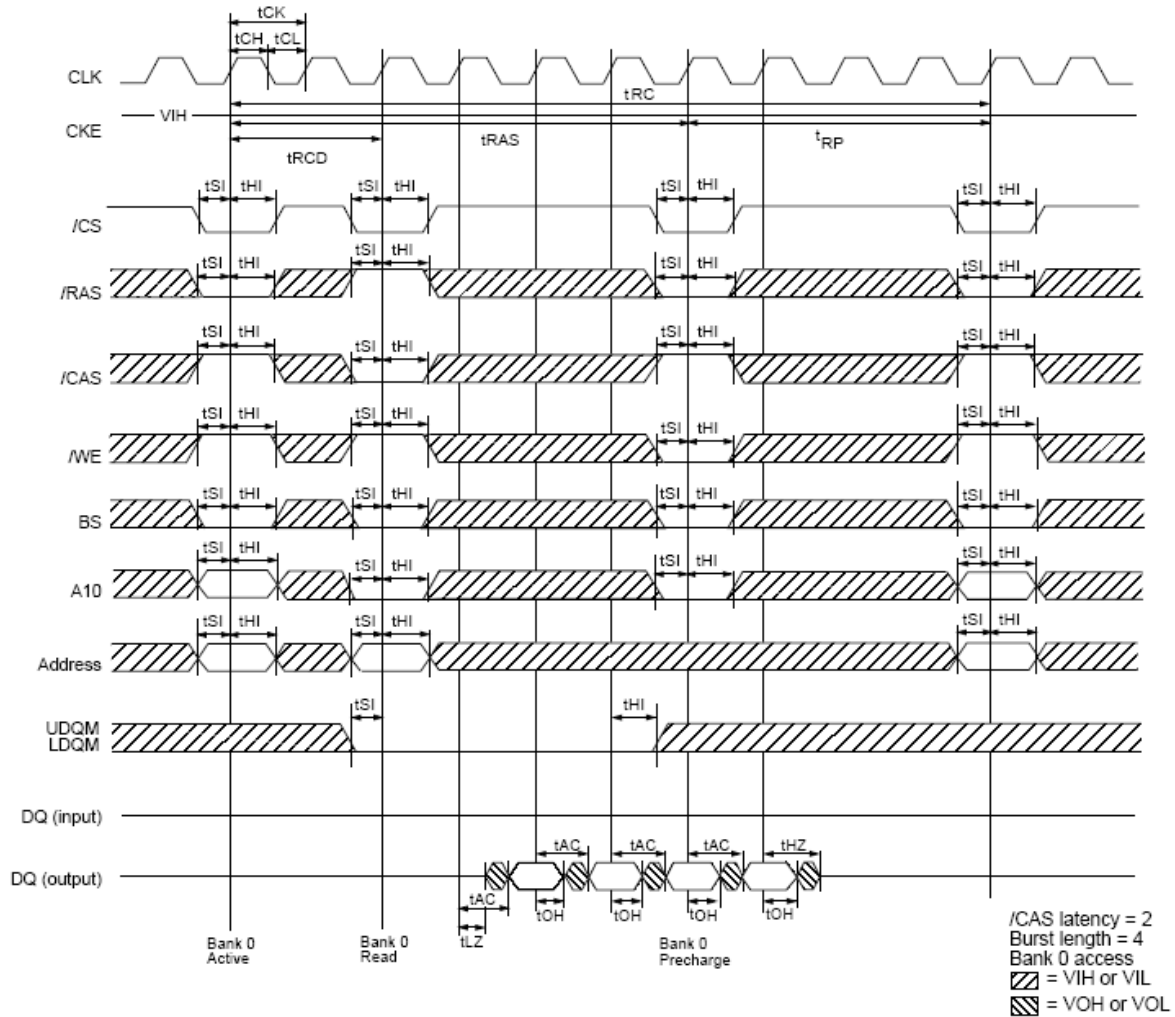

### Clock suspend mode

By driving CKE to Low during a bank active or read/write operation, the SDRAM enters clock suspend mode. During clock suspend mode, external input signals are ignored and the internal state is maintained. When CKE is driven High, the SDRAM terminates clock suspend mode, and command input is enabled from the next clock. For details, refer to the "CKE Truth Table".

Test Requested : In accordance with the RoHS Directive 2002/95/EC, and its amendment directives.

Test Method : (1) With reference to BS EN 1122:2001, Method B for Cadmium Content.  
Analysis was performed by ICP  
(2) With reference to EPA Method 3050B for Lead Content.  
Analysis was performed by ICP  
(3) With reference to EPA Method 3052 for Mercury Content.  
Analysis was performed by ICP  
(4) With reference to EPA Method 3060A & 7196A for Hexavalent Chromium.  
Analysis was performed by UV/Vis Spectrophotometry.  
(5) With reference to EPA Method 3540C/3550B for PBB / PBDE Content.  
Analysis was performed by GC/MS.

## 1. DETERMINATION OF HEXAVALENT CHROMIUM BY METHOD US EPA 3060A/7196A

Sample Preparation  
↓  
Add colour-developing reagent  
↓  
Acidify with H<sub>2</sub>SO<sub>4</sub>  
↓  
Let stand for 5-10 min  
↓  
Analyses by UV- Spectrophotometer (540 nm)

## 2. DETERMINATION OF LEAD CONTENT BY US EPA 3050B

Cut sample in small pieces  
↓  
Weight sample (1.0g) into digestion vessel  
↓  
Acid digestion (HCl and HNO<sub>3</sub>)  
↓  
"Totally Dissolved"  
↓  
Analyses by ICP

## 3. MICROWAVE ASSISTED ACID DIGESTION OF SILICEOUS AND ORGANICALLY BASED METRICES (US EPA 3052)

Cut sample in small pieces  
↓  
Weight sample (0.2-0.5g) into digestion vessel  
↓  
Acid digestion (HF and HNO<sub>3</sub>) – Microwave  
↓  
"Totally Dissolved"  
↓  
Analyses by ICP

## 4. PLASTIC – DETERMINATION OF CADMIUM – WET DECOMPOSITION METHOD (EN 1122) – METHOD B

Cut sample in small pieces  
↓  
Weight sample (1.0) into Kjeldahl flask  
↓  
Acid digestion (H<sub>2</sub>SO<sub>4</sub>)  
↓  
"Totally Dissolved"  
↓  
Analyses by ICP

## 5. DETERMINATION OF PBB/PBDE WITH GC-MS

Cut sample in small pieces  
↓  
Weight sample (2g) into extraction thimble  
↓  
Soxhlet Extraction with Toluene  
↓  
Filter through 0.45 um membrane filter  
↓  
Analyses by GC-MS (with appropriate dilution)

**Non-Contain of Restricted Hazardous Substance Guarantee Letter**

本公司特在此保證：

本公司交付給台康資訊公司所有的產品(產品、零組件、材料、模組、包裝材料、製程用料等均屬之)，決不含有台康資訊公司所規範的禁用危害物質(如附表一：GP、GP2保證物質類別管制表)。而且當所交付之產品含有之禁用物質如有任何變更時，本公司亦負有主動修改相關資料及通知台康資訊公司知悉之責任。

以上針對禁用物質的保證內容如有不實，因而造成台康資訊公司任何之信譽損害或相關之費用產生，本公司願意承擔所有應負之責任。

We hereby guarantee：

Our company provides TAICOM DATA SYSTEM Company of all products(product, component, raw material, module, packaging material, production used related materials) such that it doesn't include restricted hazardous substance as stipulated in the document (Chart I: GP, GP2 Substance Management Form). And if there is any modification to the products or components. We will modify the document and will notify TAICOM DATA SYSTEM Company.

If the above statements has any falsification, which damages TAICOM image or bear any expenses. We will shoulder all the responsibility.
